Climate Change

In the video we can see Greta Thunberg, a 16-year-old girl diagnosed with autism and OCD. In her conference on climate change makes a strong criticism about the indifference of big countries. In her speech she recalls the importance of taking action, potentially reducing the toxic emissions that affect the world to achieve collective well-being. Basically, replace the importance of the SDGs, especially the #13 "shareholder climate", because if our planet dies, we too. Therefore, without an ideal environment for life the other goals would not make sense. For Greta Thunberg, if we managed to become aware of protecting and acting for our planet, we could eventually meet each of the SDGs. In other words, we would live in a worthy world for everyone regardless of anything.

In Puerto Rico we can see the consequences of global warming and how it is affecting climate change. We have experienced the effects of not being aware of what Thunberg said, or following the SDGs. One of the most important consequences was Hurricane Maria. A phenomenon, from which we are still recovering, causing thousands of deaths and millionaire damages on the island. In the same way, the sequences in the country are increasingly constant due to the intense heat and weather conditions that affect the possibility of rain. Another thing is the erosion of the coasts of Puerto Rico

consequences of climate change such as sea level rise and atmospheric events like hurricanes and tropical storms.
