Prof. Jesus Lopez

### **SDG's in Puerto Rico**

In the video we can see Professor Jesus Lopez discuss the SDGs a little more. There is a total of 17 goals that each one of them consists for the best environment. If everyone took climate change and the damage, we do to the environment in different ways seriously, we could live in harmony and on a very prosperous planet. Because each of the goals has its purpose, so that we can live fully in a world without pollution.

In Puerto Rico we can see the consequences of global warming and how it is affecting climate change. We have experienced the effects of not being aware of what Thunberg said, or following the SDGs. One of the most important consequences was Hurricane Maria. A phenomenon, from which we are still recovering, causing thousands of deaths and millionaire damages on the island. In the same way, the sequences in the country are increasingly constant due to the intense heat and weather conditions that affect the possibility of rain. Another thing is the erosion of the coasts of Puerto Rico consequences of climate change such as sea level rise and atmospheric events like hurricanes and tropical storms.
